

In 1905, Albert Einstein published a series of groundbreaking papers that transformed modern physics, including his work on the photoelectric effect, Brownian motion, and special relativity. At the time, Albert Einstein was working as a patent clerk in Bern without a formal academic appointment. Despite this, his insights into the nature of light and the structure of space and time challenged centuries of classical physics. A decade later, his theory of general relativity further revolutionized our understanding by redefining gravity itself.
